THE SYM-1 USERS' GROUP NEWSLETTER

ISSUE NUMBER 1 - JANUARY/FEBRUARY 1980

SYM-PHYSIS is a bimonthly publication of the SYM Users' Group, P. O. Box 315, Chico; CA. 95927. SYM-PHYSIS and the SYM Users' Group (SUG) are in no way associated with Symertek Systems Corporation (SSC), and SSC has no responsibility for the contents of SYM-PHYSIS. SYM is a resistered trademark of SSC. SYM-PHYSIS, from the Greek, means the state of growing together, to make grow, to bring forth.

We welcome for publication all articles dealing with any aspect of the SYM-1, and its very close relatives. Authors retain all commercial copyrights. Portions of SYM-PHYSIS may be reproduced by clubs and educational institutions, and adaptations of programs for other computers may be freely published, with full credit given and complimentary copies provided to SYM-PHYSIS and the original author(s). Please include a self-addressed stamped envelope with all correspondence.

Editor/Publisher:
Business/Circulation:

H. R. "Lux" Luxenbers Jean Luxenbers

SUBSCRIPTION RATES:

USA/Canada \$9.00 for a volume of 6 issues; overseas \$12.50. Make checks payable in US dollars to "SYM Users' Group," F. O. Box 315, Chico, CA 95927, Telephone (916) 895-8751.

Copies of the Introductory Issue, while they last, are available for \$1.50 postpaid anywhere in the world.

EDITOR'S NOTES:

We were quite unprepared for the delude of subscriptions, articles for publication, and purchase orders which began arriving within a few days of the mailing of the Introductory Issue. We were especially surprised at the large number of overseas subscribers, since we had not realized so many SYM-Is had been sold abroad.

We wish to thank Symertek Systems Corporation for their help and cooperation in setting the SYM-1 Users' Group and SYM-PHYSIS going, by the printing and mailing of the Introductory Issue, and we hope that the SYM-biotic relationhip between SSC and SUG continues.

We did expect many questions about features of the SYM-1 hardware and firmware and many questions beginning with "How do I ", so we were not too surprised by these. Where the answers were easy, we wrote immediately. Where the questions were not so easy to answer, we are still "researching," and we will answer as soon as possible. Many of your questions about the features of SUPERMON are answered in the programs and articles in this issue.

This issue and the Introductory Issue both emphasize Utility Programs. We feel that having programs such as RELOCATE, DISASSEMBLE, FIND, RENUMBER, MERGE, etc., on call, make programming a less frustrating task.

Now that the most important utility programs are available, future issues will concentrate on applications.

One of our colleagues, Tom Gettys, Lecturer in Mathematics at California State University, Chico; and I are just beginning to interface dual mini-disks to our systems. RAE has built in linkages for disk (these are not described in the manual), BASIC links for SAVE and LOAD are in rage zero, and can be trapped to transfer to disks, and MON can have .S3 and .L3 added for disk transfers. We are also "PEEKing" around in BASIC so that we can use its subroutines for our own purposes. We will keep you posted on our progress in these areas.

We have been asked by many subscribers for dur recommendations on how to implement the expansion capabilities of the SYM-1, i.e., what sort of motherboard should they buy? Believe it or not, we have no recommendations to make. Our system is laid out flat on a 2ft x 2ft board, which sits on a work table. The various add-on boards lie flat on the supporting board. We have a 16K memory board designed for the Motorola EXORCISOR Buss cabled to the expansion port, and will be adding a disk controller designed for the KIM-4 Buss in parallel to the expansion port. Various D/A boards and prototyping sockets are cabled to the applications connectors. The system does get dusty but it is working. If we had any recommendation at all to make, it would be for you to decide for yourself which you would like the best. Note that while Commodore is "supporting" the KIM-4 Buss, the other two suppliers of the 65XX family, Symertek and mean increased commonality between 65XX and 68XX systems.

We are tabulating the data on the subscription blanks you sent in to determine what the typical SYM system looks like, and there is no such thing. There is no such person as a typical SYM user either. We do feel, however, that perhaps half of the material in each issue will be of value to each user or system, no matter what his (there are no hers!) backsround or system capabilities. We certainly hope so.

There were more articles submitted then we had room for, and this will continue to be the case, since the majority of subscribers voted for commented source code, rather than the space-saving object code dumps. We had some excellent tutorial articles on the keyboard/display interface, power-on reset, cassette problems, etc. There were some great programs which it hurt us to leave out. If the authors give permission, we will publish the titles and descriptions of these items, and offer them for sale by the half-ounce (2 pages plus envelope per half-ounce). Not being facetious here, overseas airmail is \$0.31 per half-ounce!

COMING ATTRACTIONS:

In Issue No 2 we will (really) set around to graphics and music, with both hardware and software considerations (e.g., D/A converters), and lots of references. We will include oscilloscope and terminal graphics and include a program by Carl Moser (part BASIC/part 6502) which shows how to map the CRI terminal memory into a portion of the SYM memory to provide for more interactive capability. Also a number of very short, but sweet, utilities will be published.

SPECIAL NOTICE RE RAE-1/2

The two chip version of RAE-1/2 is now available through the SYM Users' Group. If you have been worried about not having enough ROM sockets on the SYM to hold both BAS-1 and the two chip version of RAE-1/2, see the article by George Wells, on page 18 of this issue, for how to make the sockets do double duty. The addition of RAE to BAS and SUPERMON makes SYM-1 the most powerful and versatile single board computer available today. We would not have even considered publishing SYM-PHYSIS without the use of RAE as a word processor. Ordering information on back page.

The following paragraphs, written by Tom Gettys, extracted from the RAE-1 Reference Manual, express beautifully the advantages of switching over from "hand-assembly" to the use of a symbolic assembler as early as is financially practical, that is, as soon as you can get a terminal:

An assembler is a program which allows the user to compose and enter programs at the machine language level in a form that is much more convenient than actual machine code. The assembler accepts mnemonic names for individual instructions, allows symbolic names to be assigned to memory locations and data, provides for address arithmetic in terms of symbolic names, and certain other features, depending on the sophistication of the assembler in question.

It is commonly thought that the primary feature offered by an assembler is that of writing machine instructions in a more convenient form. However, this is only one aspect of the advantage of an assembler, and perhaps not even the most significant. The use of symbolic names to represent numbers makes variables of what most likely would have been considered constants. The very presence of symbols bestows a generality and flexibility to a program which otherwise might have seemed quite rigid. This encourages the programmer to abstract the immediate problem and perhaps develop a more adaptable program. Also, since the actual calculation or assignment of a value to a symbol can be deferred; the development of logically separate modules can proceed freely. Frograms so organized become much more readable and manageable, both in their maintenance and amenability to revision.

The least expensive, smallest, 6502 symbolic assembler/editor I know of is Robert Denison's 2K Symbolic Assembler (2KSA); one of the best ones I know of is Synertek's RAE-1, in ROM. If you have only the on-board 4K of RAM, consider the 2KSA. If you have also an extra 8K at 2000-3FFF, and don't mind cassette loading, consider Carl Moser's Macro-Assembler/Text Editor (ASSM/TED) for the SYM-1. The 2KSA is ideal for minimal systems, ASSM/TED and RAE-1 can also be used in word processing systems.

As you probably have discovered by this time, there is no "standard" 6502 assembly language syntax. Bob Tripp, in an editorial in MICRO, No. 2 (Dec 77-Jan 78), said, (and I quote!) ".. MOS Technology syntax is so horrible." Hal Chamberlin, in MICRO, No. 4 (April-May 1978) took a very strongly opposing viewpoint. In any event, the controversy centers on Whether the addressing mode should be indicated in the opcode field or in the operand field. I have used both, and have no strong preference. For the benefit of newcomers to assembly language programming a conversion table is provided below, with notes describing minor variations in syntax within the two major schools of thought.

Also shown below is an example of the use of 2KSA for a simple program. The full power of a symbolic assembler is apparent, however, only when it becomes necessary to modify the program to incorporate new features, such as, in the example given, to relocate and to include JSR BEEP.

SYM-PHYSIS 1-3

SSC Technical Note #49; December 1978, (pages 12 and 13 of "Technical Notes") presents a Rotating Display program in MOS Technology assembly form. Presented here is the same program in 2KSA with the following modifications:

- 1) Since 2KSA occupies 0200-09FF the program is assembled at the 2KSA default location 0C80, rather than at 0200. The program is hamed "ISPLY".
- 2) Since 2KSA does not permit absolute addressing within a module, the final JMP is replaced with CLV/BVC (other methods for forcing an unconditional branch may be substituted).
- 3) FILE has been moved to 0D00 and COUNT has been moved to 0060 to avoid conflict with 2KSA and its page zero variables (0000-005B).
 - 4) FILE (0D00-0D06) contains the segment codes for "HELLO ".

Following -ASSEM to assemble, -PRINT 00T031 to print the object/source code summary, and -SYM.. to print the origin location and symbol table, SUPERMON was called with \$. (For the purpose of this example, the ESC code 1B at 0776 was replaced with the \$ code 24 to provide a printable character.) The program at 0100 (ending with BRK) is a patch to transfer selected pointers from page zero to unused memory in page 0B. The source code, symbol table, and pointers were then dumped to cassete.

The second printout shows the method used to reenter, relocate, modify, and store the object code for a previously saved source code. The patch at 0100 (same as the one mentioned above) and the method for relocation of the orisin can be written in a more elegant form. The form given here is the KIM version appearing in the first update to the 2KSA. After the object code is stored, exit is made with \$ (or ESC) to the monitor, the data for FILE is entered at 0D00, and the program is run (successfully) at 0E00. There was no requirement to use either -PRINT or -SYM... but these were entered to show the new origin, an added entry to the symbol tables, and the corrected object code. Source code can be saved on tape only prior to -STORE, since -STORE erases all local labels.

The addresses, -0000, etc., provided as prompts by 2KSA are for the source code storage area. In the object/source code printout, the first six columns are the object code, and the last two columns are the object code addresses relative to the origin. The remaining columns are the source code. The 01 and 06 following DISBUF are additive offsets to DISBUF; i.e., DISBUF+1 and DISBUF+6 are being specified.

In the printout below entries made by the user are enclosed within "frames"; items outside the frames are 2KSA-senerated prompts and outputs.

One of the interesting features of 2KSA is that, due to the method of encoding the source code for storage and processing, the source code and the object code are exactly the same length, and correspond byte-by-byte.

This example does not show error messages (since no errors were made!) or the full editing capability provided by -INSRT to insert, delete, correct, replace, or append lines, depending on the line number syntax entered.

ADDRESSING MODE SYNTAX COMPARISIONS

	MODE	2KSA	RAE-1
1.	Absolute		
2.	Implied		
3.	Relative		
4.	Immediate	*	*
5.	Zero Pase	Z	*
6.	Accumulator	Α	Á
7.	Absolute Indexed X	X	,X
	Absolute Indexed Y	Y	,Y
9.	Zero Page Indexed X	ZX	*,X
	Zero Page Indexed Y	ZY	*,Y
	Indirect	I	()
	Indexed X Indirect	ΪX	(,X)
	Indirect Indexed Y	ΙΫ́	() • Y

Note 1: In 2KSA the addressing mode information is in the opcode field. In RAE-1 it is in the operand field.

Note 2: In MOS Technology/System 65 suntax the "*" to denote zero rage addressing is not used. Otherwise identical with RAE-1.

NOTE 3: In MICRO masazine syntax IM is used for immediate mode instead of "*". Otherwise identical with 2KSA.

Miscellaneous Notes on 2KSA: 2KSA is self-formatting, i.e., entry of a single space tabs to the next field. The first line printed after the -SYM.. command is the module's origin address followed by "..". The cold start is at 05B8, the warm start is at 05D6. A more elegant way to relocate the origin is to replace the "?" (3F) at locations 0681 and 09D0 with "-" (2D), then use -REDEF before -STORE. The patch at 0100 can then be modified to jump to the warm start (4C D6 05).

RELOCATE FOR THE SYM-1

If you are limited to hand assembly, or even if you are not, the program RELOCATE, adapted from Jim Butterfield's program in the First Book of KIM, can be very useful. Since the published program is well commented, comments have been omitted from this version. Be careful with RELOCATE; a tape backup of the original program is advisable. Here are the rules for RELOCATE:

- Programs to be relocated should have an FF inserted after the last executable instruction and before any tables.
- RELOCATE will modify only instructions between the start
 address and the FF, but assumes any addresses referring to
 tables and programs beyond the FF and up to the page limit
 are to be modified.
- RELOCATE will take care of all relative addresses but will sive no warning if you have "spread" the program too far.
- 4. RELOCATE will take care of all absolute addresses if they are not below the start of the program or above the page limit (set by default to 80).
- RELOCATE will NOT handle vectors or addresses in tables.
 These must be handled "manually."
- After using RELOCATE use .B with three parameters to do the actual moving.
- 7. Sometimes, but not always, you can use .B before .R, for example, when down-movins but not when up-movins an entire program. This is because when you block move an entire program up before using RELOCATE all absolute addresses within the program are now below the start of the program, and will not be modified.

The parameters have the following meanings:

P1 is the sidned "adjustment," e.d.,
0004 up 04 bytes
FFFC down 04 bytes
0200 up 02 pages
FE00 down 02 pages

P2 is the program starting address.

P3 is the start address of the block to be moved.

It will equal P2 if the entire program is to be moved.

It will be greater than P2 if a "sar" is to be opened or closed.

Two examples of the use of RELOCATE are given following the listing.

MORE SUPERMON EXTENSIONS

Elsewhere in this issue are examples of how to add new commands of "recognized" syntax to the monitor. Several of you have asked about the new unrecognized syntax vector in MON 1.1. Here are some hints on its use. Suppose you wish to include "named" tare saves and loads to the monitor, e.g., S2 BLACKJACK,0200,0735, or L2 BLACKJACK. This would be quite elegant, no? This is easily done by Pointing URSVEC to subroutines to do the Job. Perhaps we'll rublish the solution next issue. Note that URSVEC is called whenever either a delimiter other than a comma is used, or more than three parameters are entered, or a nonhex character is entered. It might be simpler to use a special symbol before the file name, like % or \$, since the B in BLACKJACK is a hex character, and would have been "lost" before the unrecognized syntax was "recognized." While we used .D and .R with non-recognized numbers of parameters for our DISASSEMBLE and RELOCATE programs, if there had been a conflict in numbers of parameters, we could have used other letters, or the unimplemented user functions, UO through U7, which are more easily called from the hex keyrad. SYM-PHYSIS 1-7 MERGE AND DELETE FOR SYM BASIC

The purpose of this routine is to provide a machine language means for merging two BASIC programs on the SYM-1. As a side benefit, selective deletion (actually selective retention) is also possible.

The merse is accomplished in 2 steps. First, the current program is saved in ASCII format at the top of the memory allocated to BASIC. This is accomplished by chansing the output vector so that the ASCII output stream is trapped and sent to high memory instead of to the terminal by the LIST command, using any of the available line number betions. A new BASIC program may be entered by using the NEW command and entering the program from the terminal, or a previously SAVEd program may be LOADed. When you are ready to MERGE in the previously saved program, the input vector is altered so that the ASCII input stream is obtained from high memory instead of the keyboard.

The instructions for use are simple: Call MERGE via the USR command. The prompt symbol ":" will be printed. There are only three valid commands; LIST, MERGE and E.

LIST causes the current program to be saved in high memory. If a range is specified (e.s., LIST 100-10000) only those lines within that range will be transferred.

(or any word beginning with M) causes the code saved in high memory to be retrieved. If MERGE is terminated with a slash (/), instead of a carriage return, terminal echo will be suppressed during the transfer.

exits to BASIC.

MERGE

To delete a block of lines, use the LIST command and specify the lines to be kept. Now type NEW to clear away the current program, and then enter MERGE again and use the MERGE command.

This prodram may be interfaced with the BASIC Terminal Control Patch given in the last issue of SYM-PHYSIS by simply changing the address INTCHR in the macro at line 1310 to the address of GET.CHR in the Terminal Control Patch. If you are using the Terminal Control Patch you may also wish to modify it to allow you to call MERGE with some special character, as for example, CTRL M, instead of with USR.

THE USR FUNCTION IN BASIC

The first time you call the MERGE function, described elsewhere in this issue, you must call it as X = USR(4096,0) or X = USR(1000°,0). All future calls may be of the simpler form X = USR(0), since any time you call USR with just one parameter, the location of the previous call is assumed. This makes it much easier to use. Note that you must pass at least one parameter, even when not needed, so that the A and Y resisters are not preserved. If you wish USR to return a value to the calling variable your subroutine must load A with the high byte and Y with the low byte, and return, not with RTS, but with JMP to \$D14C. USR in SYM BASIC is very versatile in allowing the passing of multiple parameters; not too many similar BASICs allow this feature.

NEW PUBLICATION: Add to your list of periodicals "COMPUTE. The Journal for Progressive Computing." This is the successor to the PET Gazette, and now covers all 6502 systems. Six issue subscription \$9.00 US and Canada, \$22.50 Europe Air Mail, elsewhere inquire for rates. Contact Bob Lock, Small Systems Services, Inc., P.O. Box 5119, Greensboro, NC 27403.

```

EXAMPLE 1: Eliminate the NOPs (EA) in the "trivial" program below.

2800 4C 05 28 EA EA DO F9 FF

.D 2800

EXAMPLE 2: Interchanse the locations of RELOCATE and DISASSEMBLE.

RELOCATE is at 2200-22FF with possible sarbase at 223D-2260. DISASSEMBLE is at 2000-21FF. Do the following:

- 1. .G 2200 to patch programs
- 2. Insert FF at 211A following last instruction
- 3. .F AA,223D,2260 to kill sarbase
- 4. .R 0100,2000,2000 to relocate
- 5. .B 2300,2000,21FF to save temporarily.
- 6. .B 2000,2200,22FF to copy RELOCATE
- 7. .R FE00,2000,2000 to relocate
- 8. .B 2100,2300,24FF to position correctly
- 9. Correct addresses as follows: 200C from 22 to 20 203C from 1E to 21
- 10. .G 2000 to repatch correctly
- 11. Save 2000-22FF on cassette

INPUT LOWER-CASE WITH (OR IN SPITE OF) SUPERMON

By Gary K. Humphrey PSC #2: Box 12203

APO San Francisco, CA 96367

The SYM Technical Notes package contains a short routine which allows input of lower case characters. I have been using a different method which is even shorter (see program listing). Just place these instructions answhere in memory (I have them at the entry to my video driver) and change INVEC to point to them. The return address stored on the stack will be changed so that your input routine will return to the monitor at INRT1 (BA2D), thereby avoiding the SUPERMON routine which converts lower-case characters to upper-case.

1E0A- 68	PLA	Pull return address (low) from
		stack and discard,
1E0B- A9 2C	LDA #2C	Load new return address (low)
1EOD- 48	PHA	and rush it onto the stack.
1F0F- 4C 58 8A	JMP INTCHR	Then get character input:

NOTE: the Jump at 1EOE can be chansed to point to your own input routine, if different.

SUPERMON EXTENSIONS

Elsewhere in this issue is the program RELOCATE, and in the introductory issue appeared the program DISASSEMBLE. MON 1.1 currently has the zero parameter command .R for REGISTER and the zero or one parameter command. D for DEPOSIT. The listing for RELOCATE shows how to add a two parameter .D for DISASSEMBLE and a three parameter .R for RELOCATE. If you have entered DISASSEMBLE at 2000 and RELOCATE (including the monitor patch) at 2200, you can patch the new commands to MON 1.1 by using the command .G 2200 after every RESET.

It should be obvious from the listing how other commands can be added and how the default values entered into system RAM by RESET can be replaced at the same time. The CLC prior to the RTS at line 228E is to ensure that no error message will be printed at the return from RELOCATE, and hay be required in your other extensions.

To call DISASSEMBLE enter, for example, .D 2200,16. The 2200 is the start of the program to be disassembled, the 16 will give you 22 lines on a CRT terminal.

A PROGRAM TO DISPLAY SYM-1 LED SEGMENT CODES

By Maurie Du Feu P.O. Box 257 Lindfield; NSW 2070 Australia

(Orsinally written Nov '78; modified and documented by the editor Nov '79) This short but elegant program should prove very helpful to those SYMMERS who wrote in asking for more information on how SUPERMON subroutines can be used in their own programs. It illustrates how DISBUF and RDIG at A640-A645 are used, but even more importantly, it illustrates the use of TV at A656 and DELAY at 835A. The value of TV (-09) at 0203 dives a reasonable counting rate; try varying it. DELAY permits over-riding the chosen value of TV, since every time any key on the Hex Keypad (or on the terminal, if you started the program with the terminal) is hit, an additional count is added. If TV=0 only the keys will produce a count. The two left hex digits will count from 00-FF and the right-most digit will display the symbol for which these digits are the segment code.

After you have this program entered and working you can replace the redundant JSR ACCESS at 0223 and the JSR SCAND at 0244 with NOPs (since SCAND is included in DELAY) and practice using RELOCATE and BLOCKMOVE to save the 6 bytes. The FF at 024F marks the end of the instructions (for use of RELOCATE). From 0250 to 025F are the segment codes for the hex digits 0 to F.

SUGGESTED HARDWARE MODIFICATION

By George Wells, 1620 Victoria Place, La Verne, CA 91750

I have a very simple solution to the problem of not having enough PROM sockets on board the SYM-1. All you do is stack the ROM's one on top of the other on one socket and hardwire individual chip-selects with pull-up resistors to each of them except the bottom one. I have done this with my two BASIC ROM's in socket U21 and it works fine. I plan to put the two RAE-1/2 ROM's into socket U22 and leave U23 available for a 2716 EPROM. This is what I did:

- 1. Remove Jumper L-13.
- Add 3.3K resistor from pad 13 to feed-through pad near pin 16 of I.C. U11 (+5V).
- Remove ROM 02-0020-01 from socket U22 and spring its leads slightly inward except for pin 20 (chip select) which should be bent slightly outward.
- Place ROM 02-0020-01 on top of ROM 02-0019-01 making sure that all corresponding pins are making contact with each other except of course pin 20. Secure with tape if desired.
- 5. Hand wrap a piece of 30-sause wire around pin 20 of the top ROM and brins the other end to the Jumper between pads 13 and 14.

Everybody ought to get Blalock's 4K RAM expansion board. Imagine that—30K of ROM/RAM on board the SYM. I'm going to have to get a new power supply!

FAST FOURIER TRANSFORM

Here is a Fast Fourier Transform program for those who requested it. The graph drawing portion has been omitted because it was terminal dependent; you will have to add your own. This program is based very closely on the program given by William D. Stanley and Steven J. Peterson in 'Fast Fourier Transforms on Your Home Computer,' BYTE Magazine, December, 1978. First a sample run, then the listing:

RUN Number of samples? 16

The input function is of the form sin (2 pi f t) + 0.5 cos (4 pi f t), where f is the frequency.

MISCELLANEOUS GOOD THINGS

HARDWARE: If you are into control applications, or otherwise need to do lots of prototypins, the "First Mate" provides a very generous working area immediately above the SYM, effectively on-board. From one to three "Second Mates" bring signals from the three edge connectors on the SYM-1 (without interfering with motherboard cohnections) to sockets on First Mate. Write to Richard Turpin, MicroMate, P.O. Box 50111, Indianapolis, IN 46256 for information and prices.

SOFTWARE: One of the best ways to improve your programming abilities is to study outstanding examples. One such example is the GRAPHICS DRAWING COMPILER for SYM, by Hall and Moser. While the GDC has value in and of itself, its real value to me was the know-how it provided on the design of compilers, which translate programs writen in high-level languages into machine language code for fast execution. As an example, after you have defined Macros CAR and CLRCAR to draw and erase the image of an automobile on the CRT screen, the program to move the automobile 10 units to the right is written in only 7 instructions, with a DO loop:

DEFINE (J 10) DO (EXIT J) CLRCAR CAR POSREL (0 1) END

EXIT.

RAE-1 and the GDC then generate the machine language code to do the Job. For additional information and prices write Carl Moser, Eastern House Software, 3239 Linda Drive, Winston Salem, NC 27106.

SPEECH SYNTHESIS: The SP-1 Speech Synthesizer Interface (\$49 Kit, \$69 assembled, including commented source listings) is available to interconnect the SYM-1 to the Texas Instruments "Speak & Spell (TM)" toy (around \$49). The interface PC board fits into the S & S in place of the battery and is driven through the 6522 VIA. One of the programs supplied is a hex digit speaker, to read back programs or data you have entered. Imagine entering data with .D or .M and getting SYM to give you verbal feedback! Much better than the beeper. For more information contact Dave Kemp, East Coast Micro Products, 1307 Beltran Court, Odenton, MD 21113.

MISCELLANEOUS NOTES

If you have the first printing of the MON 1.1 Enhancement Description be aware that all addresses in the listing from 84F4 through 8C70 should be increased by 5. The missing instructions are:

84F4 F0 03 BEQ DEPN 84F6 20 20 83 JSR OUTOM FTYPE "?" IF NG

84F6 20 20 83 JSR UUIUM (TITE : IF NO Cross reference table has correct addresses. (Info from Nick Vrtis.)

The first printing of the RAE-1 Reference Manual has a typographical error in reference to memory locations. RAE-1 actually resides in memory locations B000-BFFF and E000-EFFF, and there is no conflict with BAS, which co-exists at C000-CFFF and D000-DFFF. If you were able to set the correct Jumpers for BAS you should be able to figure out how to do so for RAE. Since you will be in the neighborhood answay, you might want to rearrange the Jumpers to permit two BAS chips to live as cheaply as one in the same socket, as described elsewhere in this issue.

The new address for the 6502 USER NOTES is: Eric Rehnke, 540 S. Ranch View Circle, Art. 61, Anaheim, CA 92807.

THE PARITY BIT "PROBLEM"

Gary Humphrey's program 'Input Lower Case . . . 'has a very subtle bus which can only be exterminated by using the Synertek published version. We elected to publish it 'in spite of' the bus because it does illustrate a novel use of the stack and because the bus itself is of some interest. The program will work for his terminal (Video-Plus) and many others; but can cause hangurs on terminals which generate parity bits, such as for example, the KSR-35 TTY. Sgt. Humphrey is using TINY BASIC, and probably (as do I) uses INTCHR to permit lower case input. Those with TINY will notice that soon after the JSR to the input link at 06BT, the accumulator is ANDED with \$7F to clear parity at 06BE before all the checks for NUL, RUBOUT, CR, etc. are made.

When I first used 2KSA, over a year ago, I used INTCHR for its input, and it took me many hours of experimenting spread out over several weeks to find out why 2KSA worked at school with an ASR-33 but not at home with a KSR-35. Even went to the trouble of bringing the +33 home and the -35 to school. Only when I found that the trouble was with the terminal, and not its location, did I write a simple program to print out the ASCII codes for the input characters to find out that the -35 used a parity bit. The 2KSA does not erase the parity bit (but it does not use lower case either) so INCHR is its required input point. Can't blame Denison for this omission, since it was not needed for KIM.

SYM-PATHY

One of our overseas subscribers points out that a KTM-2 costs over \$700 in his country, and that it will be a long time before he can afford one. He does have an oscilloscope, however, and asks for help in its use. My recommendation to him, and to others, in the same position is as follows:

First, implement the Oscilloscope Output Feature as described in Chapter 7 of the SYM Reference Manual, and study the listing until you understand every line of the program, including the remark following line 0088. If you note that the hex keypad has 25 keys whose values are assigned through software, you will see that you can use it as a typewriter keyboard by giving each key two meanings. Dedicate one key to shifting or unshifting the following keystrokes, and you can then enter 48 alphanumerics, punctuation marks, and some control characters with the hex keypad. Use a paper overlay over the pad, with the dual names for each key written on it. Replace the ASCII table in ROM and the character set table in page 04 by tables of your own design and write a program that will enable you to use the hex keypad and the scope as a 32 character, one line, terminal. If you add a third table to senerate the correct ASCII values for your keystrokes you can change INVEC and OUTVEC to point to these new I/O routines you have written. If you can interface an inexpensive QWERTY keyboard to one of the PIAs your input will be easier, but the output will be the same. The DISASSEMBLE program can easily be modified to use the scope as its output. Hardware is the bis expense for hobbyists, software costs only time and patience! Before I got my terminal, I modified a clock program for the SYM (A Bisital Clock Program for the SYM-1, Chris Sullivan, 9 Galsworthy Place, Bucklands Beach, Auckland, New Zealand, in MICRO No. 7, Oct-Nov 1978, pp 45-46) to use the scope display in place of the LED Display, so I have a feeling for how to do the Job. Will be harry to correspond with anyone who needs help, and will publish the first successful Score Terminal Program submitted. I am siving Mr. Sullivan's address as published in MICRO for the benefit of all of our many Australia/New Zealand subscribers.

ALL PRICES GIVEN BELOW ARE NOW OBSOLETE. PLEASE USE PRICES GIVEN ON THE MOST RECENTLY ISSUED "SHOPPING LIST".

SHOPPING LIST OF ITEMS AVAILABLE FROM SYM-1 USERS' GROUP

2K SYMBOLIC ASSEMBLER MANUAL (BY ROBERT DENISON)

\$10.25 IN US FUNDS-FIRST CLASS POSTPAID FOR NO. AMERICAN COUNTRIES.

\$11.00 IN US FUNDS-AIR MAIL POSTPAID FOR EUROPEAN COUNTRIES.

\$12.00 IN US FUNDS-AIR MAIL POSTPAID FOR ASIA/PACIFIC COUNTRIES.

2K SYMBOLIC ASSEMBLER ON CASSETTE TAPE

\$5.35 IN US FUNDS-FIRST CLASS POSTPAID FOR NO. AMERICAN COUNTRIES.

\$5.75 IN US FUNDS-AIR MAIL POSTPAID FOR EUROPEAN COUNTRIES.

\$6.75 IN US FUNDS-AIR MAIL POSTPAID FOR ASIA/PACIFIC COUNTRIES.

SYNERTEK TECHNICAL NOTES

\$4.10 IN US FUNDS-FIRST CLASS POSTPAID FOR NO. AMERICAN COUNTRIES.

\$4.60 IN US FUNDS-AIR MAIL POSTPAID FOR EUROPEAN COUNTRIES.

\$5.60 IN US FUNDS-AIR MAIL POSTPAID FOR ASIA/PACIFIC COUNTRIES.

SUPERMON VERSION 2(MON 1.1)

\$16.00 IN US FUNDS-FIRST CLASS POSTPAID FOR NO. AMERICAN COUNTRIES.

\$17.00 IN US FUNDS-AIR MAIL POSTPAID FOR EUROPEAN COUNTRIES.

\$18.00 IN US FUNDS-AIR HAIL POSTPAID FOR ASIA/PACIFIC COUNTRIES.

RAE-1/2 (THIS IS THE TWO CHIP VERSION BUT BOTH CHIPS MAY BE MOUNTED IN ONE SOCKET. FULL INSTRUCTIONS SUPPLIED ALONG WITH EXCLUSIVE UPDATING SERVICE DESCRIBING ADDITIONAL FEATURES NOT DESCRIBED IN THE SYNERTEK MANUAL).

\$99 IN US FUNDS-AIR MAILED POSTPAID-INSURED ANYWHERE IN THE WORLD.

SCHEMATIC DIAGRAM OF SYM-1

\$1.50 IN US FUNDS-AIR HAIL POSTPAID ANYWHERE IN THE WORLD.

We are truly sorry to have to raise our shirring and handling charges but we found we underestimated the cost of the packing materials and postage after we were swamped with orders for the above items. The prices quoted in the Introductory Issue did not take care of the costs, and we simply mailed the item and paid for it out of pocket. Some of our Symmers, themselves, realized our error and remitted a little more than was quoted in SYM-PHYSIS. We thank them for being so thoughtful. We know our overseas busers can save money on the postage by letting us send items by slow boat, but our policy is to send everything Air Mail unless otherwise requested.

A sood Source for Cassette Tapes is BOB MYERS, 109 FIRE LANE, NORTH CAPE MAY, NJ 08204. His prices are \$6.50 US for 10-50 foot Cassettes in soft plastic boxes-for hard boxes please add 50 cents. 4th. class postpaid.

We will be teaching a week-end course called "Microprocessor Fundamentals," for the University of Galifornia at Davis, January 25-27, 1980. The course fee is \$450.00, and each student will receive a SYM-1 plus some software goodies. If interested, please contact, University Extension, University of California, Davis, Davis, CA 95616.
